# PERRY'S CHEMICAL ENGINEERS' HANDBOOK

8TH EDITION

DON W. GREEN  
ROBERT H. PERRY

**Perry's  
Chemical  
Engineers'  
Handbook**

## **ABOUT THE EDITORS**

**Don W. Green** is Deane E. Ackers Distinguished Professor of Chemical and Petroleum Engineering and codirector of the Tertiary Oil Recovery Project at the University of Kansas in Lawrence, Kansas, where he has taught since 1964. He received his doctorate in chemical engineering in 1963 from the University of Oklahoma, where he was Dr. Perry's first doctoral student. Dr. Green has won several teaching awards at the University of Kansas, and he is a Fellow of the American Institute of Chemical Engineers and an Honorary Member of the Society of Petroleum Engineers. He is the author of numerous articles in technical journals.

The late **Robert H. Perry** served as chairman of the Department of Chemical Engineering at the University of Oklahoma and program director for graduate research facilities at the National Science Research Foundation. He was a consultant to various United Nations and other international organizations. From 1973 until his death in 1978, Dr. Perry devoted his time to a study of the cross impact of technologies within the next half century. The subjects under his investigation on a global basis were energy, minerals and metals, transportation and communications, medicine, food production, and the environment.

# Contents

For the detailed contents of any section, consult the title page of that section. See also the alphabetical index in the back of the handbook.

|   | <b>Section</b> |
|---|----------------|
| Conversion Factors and Mathematical Symbols <i>James O. Maloney</i> .....   | 1              |
| Physical and Chemical Data <i>Bruce E. Poling, George H. Thomson, Daniel G. Friend,<br/>Richard L. Rowley, W. Vincent Wilding</i> .....   | 2              |
| Mathematics <i>Bruce A. Finlayson, Lorenz T. Biegler</i> .....  | 3              |
| Thermodynamics <i>Hendrick C. Van Ness, Michael M. Abbott</i> .....   | 4              |
| Heat and Mass Transfer <i>Hoyt C. Hottel, James J. Noble, Adel F. Sarofim, Geoffrey D. Silcox,<br/>Phillip C. Wankat, Kent S. Knaebel</i> .....   | 5              |
| Fluid and Particle Dynamics <i>James N. Tilton</i> .....  | 6              |
| Reaction Kinetics <i>Tiberiu M. Leib, Carmo J. Pereira</i> .....  | 7              |
| Process Control <i>Thomas F. Edgar, Cecil L. Smith, F. Greg Shinskey, George W. Gassman,<br/>Andrew W. R. Waite, Thomas J. McAvoy, Dale E. Seborg</i> .....   | 8              |
| Process Economics <i>James R. Couper, Darryl W. Hertz, (Francis) Lee Smith</i> .....  | 9              |
| Transport and Storage of Fluids <i>Meherwan P. Boyce, Victor H. Edwards, Terry W. Cowley,<br/>Timothy Fan, Hugh D. Kaiser, Wayne B. Geyer, David Nadel, Larry Skoda, Shawn Testone,<br/>Kenneth L. Walter</i> ..... | 10             |
| Heat-Transfer Equipment <i>Richard L. Shilling, Patrick M. Bernhagen, Victor M. Goldschmidt,<br/>Predrag S. Hrnjak, David Johnson, Klaus D. Timmerhaus</i> .....  | 11             |
| Psychrometry, Evaporative Cooling, and Solids Drying <i>Larry R. Genskow, Wayne E. Beimesch,<br/>John P. Hecht, Ian C. Kemp, Tim Langrish, Christian Schwartzbach, (Francis) Lee Smith</i> .....                    | 12             |
| Distillation <i>M. F. Doherty, Z. T. Fidkowski, M. F. Malone, R. Taylor</i> .....   | 13             |
| Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation<br><i>Henry Z. Kister, Paul M. Mathias, D. E. Steinmeyer, W. R. Penney, B. B. Crocker, James R. Fair</i> .....                   | 14             |
| Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment<br><i>Timothy C. Frank, Lise Dahuron, Bruce S. Holden, William D. Prince, A. Frank Seibert,<br/>Loren C. Wilson</i> .....                 | 15             |
| Adsorption and Ion Exchange <i>M. Douglas LeVan, Giorgio Carta</i> .....  | 16             |
| Gas-Solid Operations and Equipment <i>Mel Pell, James B. Dunson, Ted M. Knowlton</i> .....  | 17             |

## vi CONTENTS

|   |  |    |
|---|--|----|
| Liquid-Solid Operations and Equipment         | Wayne J. Genck, David S. Dickey, Frank A. Baczek, Daniel C. Bedell, Kent Brown, Wu Chen, Daniel E. Ellis, Peter Harriott, Tim J. Laros, Wenping Li, James K. McGillicuddy, Terence P. McNulty, James Y. Oldshue, Fred Schoenbrunn, Julian C. Smith, Donald C. Taylor, Daniel R. Wells, Todd W. Wisdom                              | 18 |
| Reactors                                      | Carmo J. Pereira, Tiberiu M. Leib  | 19 |
| Alternative Separation Processes              | Michael E. Prudich, Huanlin Chen, Tingyue Gu, Ram B. Gupta, Keith P. Johnston, Herb Lutz, Guanghui Ma, Zhiguo Su   | 20 |
| Solid-Solid Operations and Processing         | Bryan J. Ennis, Wolfgang Witt, Ralf Weinekötter, Douglas Sphar, Erik Gommeran, Richard H. Snow, Terry Allen, Grantges J. Raymus, James D. Litster  | 21 |
| Waste Management                              | Louis Theodore, Kenneth N. Weiss, John D. McKenna, (Francis) Lee Smith, Robert R. Sharp, Joseph J. Santoleri, Thomas F. McGowan  | 22 |
| Process Safety                                | Daniel A. Crowl, Laurence G. Britton, Walter L. Frank, Stanley Grossel, Dennis Hendershot, W. G. High, Robert W. Johnson, Trevor A. Kletz, Joseph C. Leung, David A. Moore, Robert Ormsby, Jack E. Owens, Richard W. Prugh, Carl A. Schiappa, Richard Siwek, Thomas O. Spicer III, Angela Summers, Ronald Willey, John L. Woodward | 23 |
| Energy Resources, Conversion, and Utilization | Walter F. Podolski, David K. Schmalzer, Vincent Conrad, Douglas E. Lowenhaupt, Richard A. Winschel, Edgar B. Klunder, Howard G. McIlvried III, Massood Ramezan, Gary J. Stiegel, Rameshwar D. Srivastava, John Winslow, Peter J. Loftus, Charles E. Benson, John M. Wheeldon, Michael Krumpelt, (Francis) Lee Smith                | 24 |
| Materials of Construction                     | Oliver W. Siebert, Kevin M. Brooks, Laurence J. Craigie, F. Galen Hodge, L. Theodore Hutton, Thomas M. Laronge, J. Ian Munro, Daniel H. Pope, Simon J. Scott, John G. Stoecker II  | 25 |

Index follows Section 25

# Contributors

- Michael M. Abbott, Ph.D.** *Deceased; Professor Emeritus, Howard P. Isermann Department of Chemical and Biological Engineering, Rensselaer Polytechnic Institute* (Sec. 4, Thermodynamics)
- Terry Allen, Ph.D.** *Senior Research Associate (retired), DuPont Central Research and Development* (Sec. 21, Solid-Solid Operations and Processing)
- Frank A. Baczek, B.S.Ch.E.&Chem.** *Manager, Paste and Sedimentation Technology, Dorr-Oliver EIMCO* (Sec. 18, Liquid-Solid Operations and Equipment)
- Daniel C. Bedell, B.S.Ch.E.** *Global Market Manager E-CAT & Sedimentation, Dorr-Oliver EIMCO* (Sec. 18, Liquid-Solid Operations and Equipment)
- Wayne E. Beimesch, Ph.D.** *Technical Associate Director, Corporate Engineering, The Procter & Gamble Company* (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)
- Charles E. Benson, M.Eng.** *Principal, ENVIRON International Corp.* (Sec. 24, Energy Resources, Conversion, and Utilization)
- Patrick M. Bernhagen, P.E., B.S.M.E.** *Sales Manager—Fired Heater, Foster Wheeler North America Corp.* (Sec. 11, Heat-Transfer Equipment)
- Lorenz T. Biegler, Ph.D.** *Bayer Professor of Chemical Engineering, Carnegie Mellon University* (Sec. 3, Mathematics)
- Meherwan P. Boyce, Ph.D., P.E.** *Chairman and Principal Consultant, The Boyce Consultancy Group, LLC* (Sec. 10, Transport and Storage of Fluids)
- Laurence G. Britton, Ph.D.** *Process Safety Consultant; Consulting Scientist, Neolytica, Inc.* (Sec. 23, Process Safety)
- Kevin M. Brooks, P.E., B.S.Ch.E.** *Vice President Engineering and Construction, Koch Knight LLC* (Sec. 25, Materials of Construction)
- Kent Brown, B.S.Civ.E.** *Sedimentation Product Manager N.A., Dorr-Oliver EIMCO* (Sec. 18, Liquid-Solid Operations and Equipment)
- Giorgio Carta, Ph.D.** *Professor, Department of Chemical Engineering, University of Virginia* (Sec. 16, Adsorption and Ion Exchange)
- Huanlin Chen, M.Sc.** *Professor of Chemical and Biochemical Engineering, Zhejiang University* (Sec. 20, Alternative Separation Processes)

## viii CONTRIBUTORS

**Wu Chen, Ph.D.** *Fluid/Particle Specialist, Dow Chemical Company* (Sec. 18, Liquid-Solid Operations and Equipment)

**Vincent Conrad, Ph.D.** *Group Leader, Technical Services Development, CONSOL Energy Inc.* (Sec. 24, Energy Resources, Conversion, and Utilization)

**James R. Couper, D.Sc.** *Professor Emeritus, The Ralph E. Martin Department of Chemical Engineering, University of Arkansas—Fayetteville* (Sec. 9, Process Economics)

**Terry W. Cowley, B.S., M.A.** *Consultant, DuPont Engineering* (Sec. 10, Transport and Storage of Fluids)

**Laurence J. Craigie, B.S.Chem.** *Composite Resources, LLC* (Sec. 25, Materials of Construction)

**B. B. Crocker, P.E., S.M.** *Consulting Chemical Engineer* (Sec. 14, Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation)

**Daniel A. Crowl, Ph.D.** *Professor of Chemical Engineering, Michigan Technological University* (Sec. 23, Process Safety)

**Lise Dahuron, Ph.D.** *Sr. Research Specialist, The Dow Chemical Company* (Sec. 15, Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment)

**David S. Dickey, Ph.D.** *Senior Consultant, MixTech, Inc.* (Sec. 18, Liquid-Solid Operations and Equipment)

**M. F. Doherty, Ph.D.** *Professor of Chemical Engineering, University of California—Santa Barbara* (Sec. 13, Distillation)

**James B. Dunson, M.S.** *Principal Division Consultant (retired), E. I. duPont de Nemours & Co.* (Sec. 17, Gas-Solid Operations and Equipment)

**Thomas F. Edgar, Ph.D.** *Professor of Chemical Engineering, University of Texas—Austin* (Sec. 8, Process Control)

**Victor H. Edwards, Ph.D., P.E.** *Process Director, Aker Kvaerner, Inc.* (Sec. 10, Transport and Storage of Fluids)

**Daniel E. Ellis, B.S.Ch.E.** *Product Manager, Sedimentation Centrifuges and Belt Presses, Krauss Maffei Process Technology, Inc.* (Sec. 18, Liquid-Solid Operations and Equipment)

**Bryan J. Ennis, Ph.D.** *President, E&G Associates, Inc., and CEO, iPowder Systems, Inc.* (Sec. 21, Solid-Solid Operations and Processing)

**James R. Fair, Ph.D., P.E.** *Professor of Chemical Engineering, University of Texas* (Sec. 14, Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation)

**Timothy Fan, P.E., M.Sc.** *Chief Project Engineer, Foster Wheeler USA* (Sec. 10, Transport and Storage of Fluids)

**Z. T. Fidkowski, Ph.D.** *Process Engineer, Air Products and Chemicals Inc.* (Sec. 13, Distillation)

**Bruce A. Finlayson, Ph.D.** *Rehnberg Professor, Department of Chemical Engineering, University of Washington* (Sec. 3, Mathematics)

**Timothy C. Frank, Ph.D.** *Research Scientist and Sr. Technical Leader, The Dow Chemical Company* (Sec. 15, Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment)

**Walter L. Frank, P.E., B.S.Ch.E.** *Senior Consultant, ABS Consulting* (Sec. 23, Process Safety)

**Daniel G. Friend** *National Institute of Standards and Technology* (Sec. 2, Physical and Chemical Data)

**George W. Gassman, B.S.M.E.** *Senior Research Specialist, Final Control Systems, Fisher Controls International, Inc.* (Sec. 8, Process Control)

**Wayne J. Genck, Ph.D.** *President, Genck International* (Sec. 18, Liquid-Solid Operations and Equipment)

**Larry R. Genskow** *Technical Director, Corporate Engineering Technologies, The Procter & Gamble Company* (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)

**Wayne B. Geyer, P.E.** *Executive Vice President, Steel Tank Institute and Steel Plate Fabricators Association* (Sec. 10, Transport and Storage of Fluids)

**Victor M. Goldschmidt, Ph.D., P.E.** *Professor Emeritus, Mechanical Engineering, Purdue University* (Sec. 11, Heat-Transfer Equipment)

**Erik Gommeran, Dr. sc. techn.** *Research Associate, DuPont Central Research and Development* (Sec. 21, Solid-Solid Operations and Processing)

**Stanley Grossel, M.S.Ch.E.** *President, Process Safety & Design* (Sec. 23, Process Safety)

**Tingyue Gu, Ph.D.** *Associate Professor of Chemical Engineering, Ohio University* (Sec. 20, Alternative Separation Processes)

**Ram B. Gupta, Ph.D.** *Alumni (Chair) Professor of Chemical Engineering, Department of Chemical Engineering, Auburn University* (Sec. 20, Alternative Separation Processes)

**Peter Harriott, Ph.D.** *Professor Emeritus, School of Chemical Engineering, Cornell University* (Sec. 18, Liquid-Solid Operations and Equipment)

**John P. Hecht, Ph.D.** *Senior Engineer, The Procter & Gamble Company* (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)

**Dennis Hendershot, M.S.Ch.E.** *Principal Process Safety Specialist, Chilworth Technology, Inc.* (Sec. 23, Process Safety)

**Darryl W. Hertz, B.S.** *Manager, Front-End Loading and Value-Improving Practices Group, KBR* (Sec. 9, Process Economics)

**W. G. High, C.Eng., B.Sc., F.I.Mech.E.** *Consultant, Burgoyne Consultants* (Sec. 23, Process Safety)

**F. Galen Hodge, Ph.D. (Materials Engineering), P. E.** *Associate Director, Materials Technology Institute* (Sec. 25, Materials of Construction)

**Bruce S. Holden, M.S.** *Process Research Leader, The Dow Chemical Company* (Sec. 15, Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment)

**Hoyt C. Hottel, S.M.** *Deceased; Professor Emeritus of Chemical Engineering, Massachusetts Institute of Technology* (Sec. 5, Heat and Mass Transfer)

**Predrag S. Hrnjak, Ph.D., V.Res.** *Assistant Professor, University of Illinois at Urbana-Champaign; Principal Investigator—U of I Air Conditioning and Refrigeration Center; Assistant Professor, University of Belgrade* (Sec. 11, Heat-Transfer Equipment)

**L. Theodore Hutton, B.S.Mech.&Ind.Eng.** *Senior Business Development Engineer, ARKEMA, Inc.* (Sec. 25, Materials of Construction)

**David Johnson, P.E., M.S.C.E.** *Heat Exchanger Specialist, A&A Technology, B.P. p.l.c.* (Sec. 11, Heat-Transfer Equipment)

**Robert W. Johnson, M.S.Ch.E.** *President, Unwin Company* (Sec. 23, Process Safety)

**Keith P. Johnston, Ph.D., P.E.** *M. C. (Bud) and Mary Beth Baird Endowed Chair and Professor of Chemical Engineering, University of Texas (Austin)* (Sec. 20, Alternative Separation Processes)

**Hugh D. Kaiser, P.E., B.S., MBA** *Principal Engineer, PB Energy Storage Services, Inc.* (Sec. 10, Transport and Storage of Fluids)

**Ian C. Kemp, M.A. (Cantab), C.Eng.** *Senior Technical Manager, GlaxoSmithKline* (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)

**Henry Z. Kister, M.E., C.Eng., C.Sc.** *Senior Fellow and Director of Fractionation Technology, Fluor Corporation* (Sec. 14, Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation)

## x CONTRIBUTORS

**Trevor A. Kletz, D.Sc.** *Visiting Professor, Department of Chemical Engineering, Loughborough University (U.K.); Adjunct Professor, Department of Chemical Engineering, Texas A&M University (Sec. 23, Process Safety)*

**Edgar B. Klunder, Ph.D.** *Project Manager, National Energy Technology Laboratory, U.S. Department of Energy (Sec. 24, Energy Resources, Conversion, and Utilization)*

**Kent S. Knaebel, Ph.D.** *President, Adsorption Research, Inc. (Sec. 5, Heat and Mass Transfer)*

**Ted M. Knowlton, Ph.D.** *Technical Director, Particulate Solid Research, Inc. (Sec. 17, Gas-Solid Operations and Equipment)*

**Michael Krumpelt, Ph.D.** *Manager, Fuel Cell Technology, Argonne National Laboratory (Sec. 24, Energy Resources, Conversion, and Utilization)*

**Tim Langrish, D.Phil.** *School of Chemical and Biomolecular Engineering, The University of Sydney (Australia) (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)*

**Thomas M. Laronge, M.S.Phys.Chem.** *Director, Thomas M. Laronge, Inc. (Sec. 25, Materials of Construction)*

**Tim J. Laros, M.S.** *Senior Process Consultant, Dorr-Oliver EIMCO (Sec. 18, Liquid-Solid Operations and Equipment)*

**Tiberiu M. Leib, Ph.D.** *Principal Consultant, DuPont Engineering Research and Technology, E. I. du Pont de Nemours and Company (Sec. 7, Reaction Kinetics; Sec. 19, Reactors)*

**Joseph C. Leung, Ph.D.** *President, Leung Inc. (Sec. 23, Process Safety)*

**M. Douglas LeVan, Ph.D.** *J. Lawrence Wilson Professor of Engineering, Department of Chemical Engineering, Vanderbilt University (Sec. 16, Adsorption and Ion Exchange)*

**Wenping Li, Ph.D.** *R&D Manager, Agrilectric Research Company (Sec. 18, Liquid-Solid Operations and Equipment)*

**James D. Litster, Ph.D.** *Professor, Department of Chemical Engineering, University of Queensland (Sec. 21, Solid-Solid Operations and Processing)*

**Peter J. Loftus, D.Phil.** *Principal, ENVIRON International Corp. (Sec. 24, Energy Resources, Conversion, and Utilization)*

**Douglas E. Lowenhaupt, M.S.** *Group Leader, Coke Laboratory, CONSOL Energy Inc. (Sec. 24, Energy Resources, Conversion, and Utilization)*

**Herb Lutz** *Consulting Engineer, Millipore Corporation (Sec. 20, Alternative Separation Processes)*

**Guanghui Ma, Ph.D.** *Professor, State Key Laboratory of Biochemical Engineering, Institute of Process Engineering, CAS, Beijing, China (Sec. 20, Alternative Separation Processes)*

**M. F. Malone, Ph.D.** *Professor of Chemical Engineering and Dean of Engineering, University of Massachusetts—Amherst (Sec. 13, Distillation)*

**James O. Maloney, Ph.D., P.E.** *Emeritus Professor of Chemical Engineering, University of Kansas (Sec. 1, Conversion Factors and Mathematical Symbols)*

**Paul M. Mathias, Ph.D.** *Technical Director, Fluor Corporation (Sec. 14, Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation)*

**Thomas J. McAvoy, Ph.D.** *Professor of Chemical Engineering, University of Maryland—College Park (Sec. 8, Process Control)*

**James K. McGillicuddy, B.S.M.E.** *Product Manager, Filtration Centrifuges and Filters, Krauss Maffei Process Technology, Inc. (Sec. 18, Liquid-Solid Operations and Equipment)*

**Thomas F. McGowan, P.E.** *President, TMTS Associates (Sec. 22, Waste Management)*

- Howard G. McIlvried III, Ph.D.** *Consulting Engineer, Science Applications International Corporation, National Energy Technology Laboratory* (Sec. 24, Energy Resources, Conversion, and Utilization)
- John D. McKenna, Ph.D.** *President and Chairman, ETS International, Inc.* (Sec. 22, Waste Management)
- Terence P. McNulty, Ph.D.** *President, T. P. McNulty and Associates, Inc.* (Sec. 18, Liquid-Solid Operations and Equipment)
- David A. Moore, MBA, B.Sc.** *President, AcuTech Consulting Group* (Sec. 23, Process Safety)
- J. Ian Munro, P.E., B.A.Sc.E.E.** *Senior Consultant, Corrosion Probes, Inc.* (Sec. 25, Materials of Construction)
- David Nadel, P.E., M.S.** *Senior Principal Mechanical Engineer, Aker Kvaerner, Inc.* (Sec. 10, Transport and Storage of Fluids)
- James J. Noble, Ph.D., P.E., CE [UK]** *Research Affiliate, Department of Chemical Engineering, Massachusetts Institute of Technology* (Sec. 5, Heat and Mass Transfer)
- James Y. Oldshue, Ph.D.** *Deceased; President, Oldshue Technologies International, Inc.; Adjunct Professor of Chemical Engineering at Beijing Institute of Chemical Technology, Beijing, China* (Sec. 18, Liquid-Solid Operations and Equipment)
- Robert Ormsby, M.S.Ch.E.** *Process Safety Consultant* (Sec. 23, Process Safety)
- Jack E. Owens, B.E.E.** *Electrostatics Consultant, E. I. Dupont de Nemours and Co.* (Sec. 23, Process Safety)
- Mel Pell, Ph.D.** *President, ESD Consulting Services* (Sec. 17, Gas-Solid Operations and Equipment)
- W. R. Penney, Ph.D., P.E.** *Professor of Chemical Engineering, University of Arkansas* (Sec. 14, Equipment for Distillation, Gas Absorption, Phase Dispersion, and Phase Separation)
- Carmo J. Pereira, Ph.D., MBA** *DuPont Fellow, DuPont Engineering Research and Technology, E. I. du Pont de Nemours and Company* (Sec. 7, Reaction Kinetics; Sec. 19, Reactors)
- Walter F. Podolski, Ph.D.** *Chemical Engineer, Electrochemical Technology Program, Argonne National Laboratory* (Sec. 24, Energy Resources, Conversion, and Utilization)
- Bruce E. Poling** *Department of Chemical Engineering, University of Toledo* (Sec. 2, Physical and Chemical Data)
- Daniel H. Pope, Ph.D. (Microbiology)** *President and Owner, Bioindustrial Technologies, Inc.* (Sec. 25, Materials of Construction)
- William D. Prince, M.S.** *Process Engineering Associate, The Dow Chemical Company* (Sec. 15, Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment)
- Michael E. Prudich, Ph.D.** *Professor of Chemical Engineering, Ohio University* (Sec. 20, Alternative Separation Processes)
- Richard W. Prugh, M.S.P.E., C.S.P.** *Senior Process Safety Specialist, Chilworth Technology, Inc.* (Sec. 23, Process Safety)
- Massood Ramezan, Ph.D., P.E.** *Program Manager, Science Applications International Corporation, National Energy Technology Laboratory* (Sec. 24, Energy Resources, Conversion, and Utilization)
- Grantges J. Raymus, M.E., M.S.** *President, Raymus Associates, Inc.; Manager of Packaging Engineering (retired), Union Carbide Corporation* (Sec. 21, Solid-Solid Operations and Processing)
- Richard L. Rowley** *Department of Chemical Engineering, Brigham Young University* (Sec. 2, Physical and Chemical Data)
- Joseph J. Santoleri, P.E.** *Senior Consultant, RMT Inc. & Santoleri Associates* (Sec. 22, Waste Management)

## xii CONTRIBUTORS

**Adel F. Sarofim, Sc.D.** *Presidential Professor of Chemical Engineering, Combustion, and Reactors, University of Utah* (Sec. 5, Heat and Mass Transfer)

**Carl A. Schiappa, B.S.Ch.E.** *Retired, The Dow Chemical Company* (Sec. 23, Process Safety)

**David K. Schmalzer, Ph.D., P.E.** *Fossil Energy Program Manager, Argonne National Laboratory* (Sec. 24, Energy Resources, Conversion, and Utilization)

**Fred Schoenbrunn, B.S.Ch.E.** *Product Manager for Minerals Sedimentation, Dorr-Oliver EIMCO* (Sec. 18, Liquid-Solid Operations and Equipment)

**Christian Schwartzbach, M.Sc.** *Manager, Technology Development (retired), Niro A/S* (Sec. 12, Psychrometry, Evaporative Cooling, and Solids Drying)

**Simon J. Scott, B.S.Ch.E.** *President and Principal, Scott & Associates* (Sec. 25, Materials of Construction)

**Dale E. Seborg, Ph.D.** *Professor of Chemical Engineering, University of California—Santa Barbara* (Sec. 8, Process Control)

**A. Frank Seibert, Ph.D., P.E.** *Technical Manager, Separations Research Program, The University of Texas at Austin* (Sec. 15, Liquid-Liquid Extraction and Other Liquid-Liquid Operations and Equipment)

**Robert R. Sharp, Ph.D., P.E.** *Professor of Environmental Engineering, Manhattan College; Environmental Consultant* (Sec. 22, Waste Management)

**Richard L. Shilling, P.E., B.S.M., B.E.M.E.** *Vice President of Engineering, Koch Heat Transfer Company LP* (Sec. 11, Heat-Transfer Equipment)

**F. Greg Shinskey, B.S.Ch.E.** *Consultant (retired from Foxboro Co.)* (Sec. 8, Process Control)

**Oliver W. Siebert, P.E., B.S.M.E.** *Affiliate Professor of Chemical Engineering, Washington University, St. Louis, Mo.; Director, North Central Research Institute; President and Principal, Siebert Materials Engineering, Inc.* (Sec. 25, Materials of Construction)

**Geoffrey D. Silcox, Ph.D.** *Professor of Chemical Engineering, Combustion, and Reactors, University of Utah* (Sec. 5, Heat and Mass Transfer)

**Richard Siwek, M.S.** *Managing Director, President, FireEx Consultant Ltd.* (Sec. 23, Process Safety)

**Larry Skoda, P.E.** *Principal Piping Engineer, Aker Kvaerner, Inc.* (Sec. 10, Transport and Storage of Fluids)

**Cecil L. Smith, Ph.D.** *Principal, Cecil L. Smith Inc.* (Sec. 8, Process Control)

**Todd W. Wisdom, M.S.Ch.E.** *Global Filtration Product Manager, Dorr-Oliver EIMCO (Sec. 18, Liquid-Solid Operations and Equipment)*

**Wolfgang Witt, Dr. rer. nat.** *Technical Director, Sympatec GmbH–System Partikel Technik (Sec. 21, Solid-Solid Operations and Processing)*

**John L. Woodward, Ph.D.** *Senior Principal Consultant, Baker Engineering and Risk Consultants, Inc. (Sec. 23, Process Safety)*

# Preface to the Eighth Edition

*Perry's* has been an important source of information related to the fundamentals and practice of chemical engineering since it was first published in 1934, with John H. Perry both the initiator and editor. Several chemical engineers, serving as editor- or coeditor-in-chief, have guided the preparation of the different editions over the years. These include John H. Perry (first to third editions), Robert H. Perry (fourth to sixth editions), Cecil H. Chilton (fourth and fifth editions), Sidney D. Kirkpatrick (fourth edition), Don W. Green (sixth to eighth editions) and James O. Maloney (sixth and seventh editions). Robert H. Perry was also listed as an editor for the seventh edition, and is listed again as an editor for the current edition, although his tragic death occurred during the preparation of the sixth edition. Many of the ideas developed through his leadership during preparation of earlier editions carried over to the seventh and eighth editions. I owe much to the friendship and mentoring of Bob Perry.

The organization of this eighth edition is much the same as for the seventh edition, although content changes are extensive. The first group of sections includes comprehensive tables with units conversions and fundamental constants, physical and chemical data, methods to predict properties, and fundamentals of mathematics most useful to engineers. The second group, comprising the fourth through the ninth sections, covers fundamentals of chemical engineering. The third and largest group of sections deals with processes, such as heat-transfer operations, distillation, gas-liquid processes, chemical reactors, and liquid-liquid processes. The last group covers auxiliary information including waste management, safety and the handling of hazardous materials, energy sources, and materials of construction. All sections have been updated to cover the latest advances in technology related to chemical engineering. As there are a significant number of new section editors, the material in the *Handbook* has been extensively revised. Section 2, which covers physical and chemical data, has been expanded by well over 100 pages to include, among other new information, data from the AIChE Design Institute for Physical Properties.

A large number of section editors and contributors worked on this eighth edition, and these persons and their affiliations are listed as a part of the front material. Many of these authors are Fellows of the AIChE. I would like to recognize two of these colleagues, Dr. Michael M. Abbott and Dr. James Y. Oldshue, who passed away while this work was being prepared. They will be missed. A number of chemical engineering students at the University of Kansas assisted in the preparation of the index. They are Jonathan Ashley, Andrew Becker, Jonathan Bunn, Don Claus, Andrew Duncan, Meghan Easter, Bill Eckman, Justin Ellrich, Mehrdad Hosni, Kaitlyn Kelly, Jennifer Lawrence, Casey Morris, Chris Roatch, Chris Sharpe, Jeremy Steeley, Daniel Theimer, and Nick Willis. In addition, Maxine Younes, Susan Bolton, and my wife Patricia Green provided extensive secretarial assistance.

## CONVERSION OF VALUES FROM U.S. CUSTOMARY UNITS TO SI UNITS

\* Much of the material was taken from Sec. 1. of the fifth edition. The contribution of Cecil H. Chilton in developing that material is acknowledged.

**TABLE 1-1 SI Base and Supplementary Quantities and Units**

| Quantity or "dimension"               | SI unit           | SI unit symbol ("abbreviation"); Use roman (upright) type |
|---------------------------------------|-------------------|---|
| Base quantity or "dimension"          |                   |   |
| length                                | meter             | m   |
| mass                                  | kilogram          | kg  |
| time                                  | second            | s   |
| electric current                      | ampere            | A   |
| thermodynamic temperature             | kelvin            | K   |
| amount of substance                   | mole <sup>o</sup> | mol   |
| luminous intensity                    | candela           | cd  |
| Supplementary quantity or "dimension" |                   |   |
| plane angle                           | radian            | rad   |
| solid angle                           | steradian         | sr  |

<sup>o</sup> When the mole is used, the elementary entities must be specified; they may be atoms, molecules, ions, electrons, other particles, or specified groups of such particles.

**TABLE 1-2a Derived Units of SI that Have Special Names**

| Quantity  | Unit      | Symbol | Formula               |
|---|-----------|--------|-----------------------|
| frequency (of a periodic phenomenon)                          | hertz     | Hz     | 1/s                   |
| force   | newton    | N      | (kg·m)/s <sup>2</sup> |
| pressure, stress  | pascal    | Pa     | N/m <sup>2</sup>      |
| energy, work, quantity of heat                                | joule     | J      | N·m                   |
| power, radiant flux   | watt      | W      | J/s                   |
| quantity of electricity, electric charge                      | coulomb   | C      | A·s                   |
| electric potential, potential difference, electromotive force | volt      | V      | W/A                   |
| capacitance   | farad     | F      | C/V                   |
| electric resistance   | ohm       | Ω      | V/A                   |
| conductance   | siemens   | S      | A/V                   |
| magnetic flux   | weber     | Wb     | V·s                   |
| magnetic-flux density   | tesla     | T      | Wb/m <sup>2</sup>     |
| inductance  | henry     | H      | Wb/A                  |
| luminous flux   | lumen     | lm     | cd·sr                 |
| illuminance   | lux       | lx     | lm/m <sup>2</sup>     |
| activity (of radionuclides)                                   | becquerel | Bq     | 1/s                   |
| absorbed dose   | gray      | Gy     | J/kg                  |

**TABLE 1-2b Additional Common Derived Units of SI**

| Quantity                               | Unit                            | Symbol                 |
|--|---------------------------------|------------------------|
| acceleration                           | meter per second squared        | m/s <sup>2</sup>       |
| angular acceleration                   | radian per second squared       | rad/s <sup>2</sup>     |
| angular velocity                       | radian per second               | rad/s                  |
| area                                   | square meter                    | m <sup>2</sup>         |
| concentration (of amount of substance) | mole per cubic meter            | mol/m <sup>3</sup>     |
| current density                        | ampere per square meter         | A/m <sup>2</sup>       |
| density, mass                          | kilogram per cubic meter        | kg/m <sup>3</sup>      |
| electric-charge density                | coulomb per cubic meter         | C/m <sup>3</sup>       |
| electric-field strength                | volt per meter                  | V/m                    |
| electric-flux density                  | coulomb per square meter        | C/m <sup>2</sup>       |
| energy density                         | joule per cubic meter           | J/m <sup>3</sup>       |
| entropy                                | joule per kelvin                | J/K                    |
| heat capacity                          | joule per kelvin                | J/K                    |
| heat-flux density, irradiance          | watt per square meter           | W/m <sup>2</sup>       |
| luminance                              | candela per square meter        | cd/m <sup>2</sup>      |
| magnetic-field strength                | ampere per meter                | A/m                    |
| molar energy                           | joule per mole                  | J/mol                  |
| molar entropy                          | joule per mole-kelvin           | J/(mol·K)              |
| molar-heat capacity                    | joule per mole-kelvin           | J/(mol·K)              |
| moment of force                        | newton-meter                    | N·m                    |
| permeability                           | henry per meter                 | H/m                    |
| permittivity                           | farad per meter                 | F/m                    |
| radiance                               | watt per square-meter-steradian | W/(m <sup>2</sup> ·sr) |
| radiant intensity                      | watt per steradian              | W/sr                   |
| specific-heat capacity                 | joule per kilogram-kelvin       | J/(kg·K)               |
| specific energy                        | joule per kilogram              | J/kg                   |
| specific entropy                       | joule per kilogram-kelvin       | J/(kg·K)               |
| specific volume                        | cubic meter per kilogram        | m <sup>3</sup> /kg     |
| surface tension                        | newton per meter                | N/m                    |
| thermal conductivity                   | watt per meter-kelvin           | W/(m·K)                |
| velocity                               | meter per second                | m/s                    |
| viscosity, dynamic                     | pascal-second                   | Pa·s                   |
| viscosity, kinematic                   | square meter per second         | m <sup>2</sup> /s      |
| volume                                 | cubic meter                     | m <sup>3</sup>         |
| wave number                            | 1 per meter                     | 1/m                    |

**TABLE 1-4 Conversion Factors: U.S. Customary and Commonly Used Units to SI Units (Concluded)**

| Quantity      | Customary or commonly used unit   | SI unit         | Alternate SI unit                 | Conversion factor; multiply customary unit by factor to obtain SI unit |        |
|---------------|-----------------------------------|-----------------|-----------------------------------|--|--------|
| Wavelength    | Å                                 | nm              |                                   | 1.0°   | E - 01 |
| Capture unit  | 10 <sup>-3</sup> cm <sup>-1</sup> | m <sup>-1</sup> |                                   | 1.0°   | E + 01 |
|               | m <sup>-1</sup>                   | m <sup>-1</sup> | 10 <sup>-3</sup> cm <sup>-1</sup> | 1  | 1      |
| Radioactivity | Ci                                | Bq              |                                   | 3.7°   | E + 10 |

° An asterisk indicates that the conversion factor is exact.

† Conversion factors for length, area, and volume are based on the international foot. The international foot is longer by 2 parts in 1 million than the U.S. Survey foot (land-measurement use).

NOTE: The following unit symbols are used in the table:

| Unit symbol | Name           | Unit symbol | Name               |
|-------------|----------------|-------------|--------------------|
| A           | ampere         | lm          | lumen              |
| a           | annum (year)   | lx          | lux                |
| Bq          | becquerel      | m           | meter              |
| C           | coulomb        | min         | minute             |
| cd          | candela        | '           | minute             |
| Ci          | curie          | N           | newton             |
| d           | day            | naut mi     | U.S. nautical mile |
| °C          | degree Celsius | Oe          | oersted            |
| °           | degree         | Ω           | ohm                |

**TABLE 1-5 Metric Conversion Factors as Exact Numerical Multiples of SI Units**

The first two digits of each numerical entry represent a power of 10. For example, the entry “-02 2.54” expresses the fact that 1 in =  $2.54 \times 10^{-2}$  m.

| To convert from                                  | To                        | Multiply by                 | To convert from                         | To                         | Multiply by   |

**TABLE 1-5 Metric Conversion Factors as Exact Numerical Multiples of SI Units (Concluded)**

The first two digits of each numerical entry represent a power of 10. For example, the entry “-02 2.54” expresses the fact that 1 in = 2.54 × 10<sup>-2</sup>.

\*Energy units are the product of pressure units and volume units.

**TABLE 1-10 United States Customary System of Weights and Measures**

|  |  |
|--|--|
| <b>Linear Measure</b>  |  |
| 12 inches (in) or (") = 1 foot (ft) or (')   |  |
| 3 feet = 1 yard (yd)   |  |
| 16.5 feet } = 1 rod (rd)   |  |
| 5.5 yards } = 1 mile (mi)  |  |
| 5280 feet } = 1 mile (mi)  |  |
| 320 rods } = 1 mile (mi)   |  |
| 1 mil = 0.001 inch   |  |
| <i>Nautical:</i>   |  |
| 6080.2 feet = 1 nautical mile  |  |
| 6 feet = 1 fathom  |  |
| 120 fathoms = 1 cable length   |  |
| 1 knot = 1 nautical mile per hour  |  |
| 60 nautical miles = 1° of latitude   |  |
| <b>Square Measure</b>  |  |
| 144 sq. inches (sq. in) or (in <sup>2</sup> ) or (□") = 1 sq. foot (ft <sup>2</sup> ) or (□')                                  |  |
| 9 sq. feet (ft <sup>2</sup> ) (□') = 1 sq. yard (yd <sup>2</sup> )   |  |
| 30.25 sq. yards = 1 sq. rod, pole, or perch  |  |
| 160 sq. rods = $\left\{ \begin{array}{l} 10 \text{ sq. chains} \\ 43,560 \text{ sq. ft} \end{array} \right\} = 1 \text{ acre}$ |  |
| 640 acres = 1 sq. mile = 1 section   |  |
| 1 circular inch (area of circle of 1 inch diameter) = 0.7854 sq. inch  |  |
| 1 sq. inch = 1.2732 circular inch  |  |
| 1 circular mil = area of circle of 0.001 inch diameter   |  |
| 1,000,000 circular mils = 1 circular inch  |  |
| <b>Circular Measure</b>  |  |
| 60 seconds (") (sec) = 1 minute (min) or (')   |  |
| 60 minutes (') = 1 degree (°)  |  |
| 90 degrees (°) = 1 quadrant  |  |
| 360 degrees (°) = 1 circumference  |  |
| 57.29578 degrees $\left\{ \begin{array}{l} = 1 \text{ radian (rad.)} \\ = 57^{\circ} 17' 44.81'' \end{array} \right.$          |  |
| <b>Volume Measure</b>  |  |
| <i>Solid:</i>  |  |
| 1728 cubic in (cu. in) (in <sup>3</sup> ) = 1 cubic foot (cu. ft)(ft <sup>3</sup> )  |  |
| 27 cu. ft = 1 cubic yard (cu. yd)  |  |
| <i>Dry Measure:</i>  |  |
| 2 pints = 1 quart  |  |
| 8 quarts = 1 peck  |  |
| 4 pecks = 1 bushel   |  |
| 1 United States Winchester bushel = 2150.42 cubic inches   |  |
| <i>Liquid:</i>   |  |
| 4 gills = 1 pint (pt)  |  |
| 2 pints = 1 quart (qt)   |  |
| 4 quarts = 1 gallon (gal)  |  |
| 7.4805 gallons = 1 cubic foot  |  |
| <i>Apothecaries' Liquid:</i>   |  |
| 60 minims (min. or $\mathfrak{m}$ ) = 1 fluid dram or drachm   |  |
| 8 drams (ʒ) = 1 fluid ounce  |  |
| 16 ounces (oz. $\mathfrak{z}$ ) = 1 pint   |  |
| <b>Avoirdupois Weight</b>  |  |
| 16 drams = 437.5 grains = 1 ounce (oz)   |  |
| 16 ounces = 7000 grains = 1 pound (lb)   |  |
| 100 pounds = 1 hundredweight (cwt)   |  |
| 2000 pounds = 1 short ton: 2240 pounds = 1 long ton  |  |
| <b>Troy Weight</b>   |  |
| 24 grains = 1 pennyweight (dwt)  |  |
| 20 pennyweights = 1 ounce (oz)   |  |
| 12 ounces = 1 pound (lb)   |  |
| <b>Apothecaries' Weight</b>  |  |
| 20 grains (gr) = 1 scruple (ʒ)   |  |
| 3 scruples = 1 dram (ʒ)  |  |
| 8 drams = 1 ounce (ʒ)  |  |
| 12 ounces = 1 pound (lb)   |  |

**TABLE 1-11 Temperature Conversion Formulas**

|                            |
|----------------------------|
| °F = (°C × 5/9) + 32       |
| °C = (°F - 32) × 5/9       |
| °R = °F + 459.69           |
| °K = °C + 273.15           |
| °K = °R × 5/9              |
| Temperature difference, ΔT |
| °F = °C × 9/5              |

NOTE: An extensive table of temperature conversions may be found in the sixth edition of the *Handbook* (Table 1-12).

**TABLE 1-12 Greek Alphabet**

|                       |                       |
|-----------------------|-----------------------|
| Alpha = A, α = A, a   | Nu = N, ν = N, n      |
| Beta = B, β = B, b    | Xi = Ξ, ξ = X, x      |
| Gamma = Γ, γ = G, g   | Omicron = O, ο = O, o |
| Delta = Δ, δ = D, d   | Pi = Π, π = P, p      |
| Epsilon = E, ε = E, e | Rho = Ρ, ρ = R, r     |
| Zeta = Ζ, ζ = Z, z    | Sigma = Σ, σ = S, s   |
| Eta = Η, η = E, e     | Tau = Τ, τ = T, t     |
| Theta = Θ, θ = Th, th | Upsilon = Υ, υ = U, u |
| Iota = Ι, ι = I, i    | Phi = Φ, φ = Ph, ph   |
| Kappa = Κ, κ = K, k   | Chi = Χ, χ = Ch, ch   |
| Lambda = Λ, λ = L, l  | Psi = Ψ, ψ = Ps, ps   |
| Mu = Μ, μ = M, m      | Omega = Ω, ω = O, o   |

**TABLE 1-14 Fundamental Physical Constants**

|  |   |
|--|---|
| 1 sec = 1.00273791 sidereal seconds  | sec = mean solar second   |
| $g_0 = 9.80665 \text{ m/sec}^2$  | Definition: $g_0$ = standard gravity                            |
| 1 liter = 0.001 cu. m  |   |
| 1 atm = 101,325 newtons/sq m   | Definition: atm = standard atmosphere                           |
| 1 mm Hg (pressure) = $(1/760) \text{ atm}$   | mm Hg (pressure) = standard millimeter mercury                  |
| = 133.3224 newtons/sq m  |   |

## CONVERSION OF VALUES FROM U.S. CUSTOMARY UNITS TO SI UNITS

American engineers are probably more familiar with the magnitude of physical entities in U.S. customary units than in SI units. Consequently, errors made in the conversion from one set of units to the other may go undetected. The following six examples will show how to convert the elements in six dimensionless groups. Proper conversions will result in the same numerical value for the dimensionless number. The dimensionless numbers used as examples are the Reynolds, Prandtl, Nusselt, Grashof, Schmidt, and Archimedes numbers.

Table 1-7 provides a number of useful conversion factors. To make a conversion of an element in U.S. customary units to SI units, one multiplies the value of the U.S. customary unit, found on the left side in the table, by the equivalent value on the right side. For example, to convert 10 British thermal units to joules, one multiplies 10 by 1054.4 to obtain 10544 joules.

In each example, the initial values of the factors are expressed in U.S. customary units, and the dimensionless value is calculated. Then the factors are converted to SI units, and the dimensionless value is recalculated. The two dimensionless values will be approximately the same. (Small variations occur due to the number of significant figures carried in the solution.)

### Example 1. Calculation of a Reynolds Number

$$N_{Re} = \frac{DV\rho}{\mu}$$

U.S. customary units

$$D = 3 \text{ in.} = \frac{3}{12} \text{ ft}$$

$$V = 6 \text{ ft/s}$$

$$\rho = 0.08 \text{ lbm/ft}^3$$

$$\mu = 0.015 \text{ cp} = (0.015)(0.000672) \text{ lbm/ft-s}$$

$$N_{Re} = \frac{(3/12)(6)(0.08)}{(0.015)(0.000672)} = 11,904$$

SI units

$$D = (3)(0.0254) \text{ m}$$

$$V = (6)(0.3048) \text{ m/s}$$

$$\rho = (0.08)(16.018) \text{ kg/m}^3$$

$$\mu = (0.015)(0.001) \text{ kg/m-s}$$

$$N_{Re} = \frac{(3 \times 0.0254)(6 \times 0.3048)(0.08 \times 16.018)}{(0.015)(0.001)} = 11,904$$

### Example 2. Calculation of a Prandtl Number

$$N_{Pr} = \frac{C_p \mu}{k}$$

U.S. customary units

$$\gamma_p = 0.47 \text{ Btu/lbm } ^\circ\text{F}$$

$$\mu = 15 \text{ centipoise} = (15)(0.000672)(3600) \text{ lbm/ft-hr}$$

$$k = 0.065 \text{ Btu/hr-ft}^2 \text{ (} ^\circ\text{F/ft)}$$

$$N_{Pr} = \frac{(0.47)(15 \times 0.000672 \times 3600)}{0.065} = 262.4$$

SI units

$$\gamma = (0.47)(4184) \text{ J/kg } ^\circ\text{C}$$

$$\mu = (15)(0.001) \text{ kg/m-s}$$

$$k = (0.065)(1.728) \text{ J/s-m}^2 \text{ (} ^\circ\text{C/m)}$$

$$N_{Pr} = \frac{(0.47)(4184)(15)(0.001)}{(0.065)(1.728)} = 262.6$$

(Difference due to rounding)

### Example 3. Calculation of a Nusselt Number

$$N_{Nu} = \frac{hD}{k}$$

U.S. customary units

$$h = 200 \text{ Btu/hr-ft}^2 \text{ } ^\circ\text{F}$$

$$D = 1.5 \text{ in.} = 1.5/12 \text{ ft}$$

$$k = 0.07 \text{ Btu/hr-ft}^2 \text{ (} ^\circ\text{F/ft)}$$

$$N_{Nu} = \frac{(200)(1.5/12)}{0.07} = 357.1$$

SI units

$$h = (200)(5.678) \text{ J/(s-m}^2 \text{ } ^\circ\text{C)}$$

$$D = (1.5)(0.0254) \text{ m}$$

$$k = (0.07)(1.728) \text{ J/s-m}^2 \text{ (} ^\circ\text{C/m)}$$

$$N_{Nu} = \frac{(200)(5.678)(1.5)(0.0254)}{(0.07)(1.728)} = 357.7$$

(Difference due to rounding)

### Example 4. Calculation of a Grashof Number

$$N_{Gr} = L^3 \rho^2 g \beta (\Delta T) / \mu^2$$

U.S. Customary units

$$L = 3 \text{ ft}$$

$$\rho = 0.0725 \text{ lbm/ft}^3$$

$$g = 32.174 \text{ ft/s}^2$$

$$\beta = 0.00168 / ^\circ\text{R}$$

$$\Delta T = 99 \text{ } ^\circ\text{R}$$

$$\mu = 0.019 \text{ centipoise} = 0.019 \times 0.000672 \text{ lbm/ft-s}$$

$$= 1.277 \times 10^{-5} \text{ lbm/ft-s}$$

$$N_{Gr} = \frac{(3^3)(0.0725)^2(32.174)(0.00168)(99)}{(1.277 \times 10^{-5})^2} = 4.66 \times 10^9$$

SI units

$$L = (3)(0.3048) = 0.9144 \text{ m}$$

$$\rho = (0.0725)(16.018) = 1.1613 \text{ kg/m}^3$$

$$g = 9.807 \text{ m/s}^2$$

$$\beta = (0.00168)/(1.8) = 0.000933 / ^\circ\text{K}$$

$$\Delta T = (99)(1.8) = 178.2 \text{ } ^\circ\text{K}$$

$$\mu = (0.019)(0.001) = 1.9 \times 10^{-5} \text{ kg/m-s}$$

$$N_{Gr} = \frac{(0.9144)^3(1.1613)^2(9.807)(0.000933)(178.2)}{(1.9 \times 10^{-5})^2} = 4.66 \times 10^9$$

### Example 5. Calculation of a Schmidt Number

$$N_{Sc} = \frac{\mu}{\rho D}$$

U.S. customary units

$$\mu = 0.02 \text{ centipoise} = (0.02)(2.42) \text{ lbm/ft-hr}$$

$$\rho = 0.08 \text{ lbm/ft}^3$$

$$D = 1.0 \text{ ft}^2/\text{hr} \text{ (diffusivity)}$$

$$N_{Sc} = \frac{(0.02)(2.42)}{(0.08)(1.0)} = 0.605$$

SI units

$$\mu = (0.02)(0.001) \text{ kg/m-s}$$

$$\rho = (0.08)(16.02) \text{ kg/m}^3$$

$$D = (1.0)(2.58 \times 10^{-5}) \text{ m}^2/\text{s}$$

$$N_{Sc} = \frac{(0.02)(0.001)}{(0.08)(16.02)(1.0)(2.58 \times 10^{-5})} = 0.605$$

### Example 6. Calculation of an Archimedes Number

$$N_{Ar} = \frac{d^3 \rho_f (\rho_p - \rho_f) g}{\mu^2}$$

U.S. customary units

$$d = 2 \text{ mm} = 2 / [(1000)(0.3048)] = 0.00656 \text{ ft}$$

$$\rho_f = 0.0175 \text{ lbm/ft}^3$$

$$\rho_p = 168.5 \text{ lbm/ft}^3$$

$$g = 32.174 \text{ ft/s}^2$$

$$\mu = 0.04 \text{ centipoise} = 0.04 \times 0.000672 = 2.688 \times 10^{-5} \text{ lbm/ft-s}$$

$$N_{Ar} = \frac{(0.00656)^3(0.0175)(168.5 - 0.0175)(32.174)}{(2.688 \times 10^{-5})^2} = 37,064$$

SI units

$$d = 2/1000 \text{ m}$$

$$\rho_p = 168.5 \times 16.02 = 2699.37 \text{ kg/m}^3$$

$$\rho_f = 0.0175 \times 16.02 = 0.2804 \text{ g/m}^3$$

$$g = 9.807 \text{ m/s}^2$$

$$\mu = 0.04 \times 0.001 = 4 \times 10^{-5} \text{ kg/m-s}$$

$$N_{Ar} = \frac{(2/1000)^3(0.2804)(2699.37 - 0.28)(9.807)}{(4 \times 10^{-5})^2} = 37,118$$

(Difference due to rounding)

## 2-4 PHYSICAL AND CHEMICAL DATA

### Tables

|                |   |       |       |  |       |
|----------------|---|-------|-------|--|-------|
| 2-202          | Saturated Carbon Tetrafluoride (R14)  | 2-245 | 2-258 | Thermodynamic Properties of R-41, Fluoromethane                                  | 2-348 |
| 2-203          | Thermodynamic Properties of Carbonyl Sulfide                                      | 2-246 | 2-259 | Saturated R-401A (SUVA MP 39)  | 2-350 |
| 2-204          | Saturated Cesium  | 2-248 | 2-260 | R-401A (SUVA MP 39) at Atmospheric Pressure                                      | 2-350 |
| 2-205          | Thermophysical Properties of Saturated Chlorine                                   | 2-249 | 2-261 | Thermodynamic Properties of Saturated R-407A (Klea 60)                           | 2-351 |
|                | Enthalpy-Log-Pressure Diagram for Chlorine (Fig. 2-9)                             | 2-250 | 2-262 | Thermodynamic Properties of Saturated R-407B (Klea 61)                           | 2-351 |
| 2-206          | Saturated Chloroform (R20)  | 2-251 |       | Enthalpy-Log-Pressure Diagram for R-407A (Klea 60)                               |       |
| 2-207          | Thermodynamic Properties of Cyclohexane   | 2-252 |       | (Fig. 2-22)  | 2-352 |
| 2-208          | Thermodynamic Properties of Decane  | 2-254 |       | Enthalpy-Log-Pressure Diagram for R-407B (Klea 61)                               |       |
| 2-209          | Thermodynamic Properties of Deuterium Oxide (Heavy Water)                         | 2-256 | 2-263 | (Fig. 2-23)  | 2-353 |
|                |   |       | 2-264 | Saturated R-404A (SUVA HP 62)  | 2-354 |
| 2-210          | Thermodynamic Properties of 2,2-Dimethylpropane (Neopentane)                      | 2-258 |       | R-404A (SUVA HP 62) at Atmospheric Pressure                                      | 2-354 |
| 2-211          | Saturated Diphenyl  | 2-260 | 2-265 | Enthalpy-Log-Pressure Diagram for Refrigerant 123                                |       |
| 2-212          | Thermodynamic Properties of Dodecane  | 2-261 | 2-266 | Saturated R-401B (SUVA MP 66)  | 2-355 |
| 2-213          | Thermodynamic Properties of Ethane  | 2-263 | 2-267 | R-401B (SUVA MP 66) at Atmospheric Pressure                                      | 2-355 |
| 2-214          | Thermodynamic Properties of Ethanol   | 2-265 | 2-267 | Saturated R-402A (SUVA HP 80)  | 2-355 |
|                | Enthalpy-Concentration Diagram for Aqueous Ethyl Alcohol (Fig. 2-10)              | 2-267 | 2-268 | R-402A (SUVA HP 80) at Atmospheric Pressure                                      | 2-356 |
| 2-215          | Thermodynamic Properties of Ethylene  | 2-268 | 2-269 | Saturated R-402B (SUVA HP 81)  | 2-356 |
| 2-216          | Thermodynamic Properties of Fluorine  | 2-270 | 2-270 | R-402B (SUVA HP 81) at Atmospheric Pressure                                      | 2-356 |
| 2-217          | Flutec  | 2-271 | 2-271 | Thermodynamic Properties of R-113, 1,1, 2-Trichlorotrifluoroethane               | 2-357 |
| 2-218          | Halon   | 2-271 | 2-272 | Thermodynamic Properties of R-114, 1, 2-Dichlorotetrafluoroethane                | 2-359 |
| 2-219          | Thermodynamic Properties of Helium  | 2-272 | 2-273 | Saturated Refrigerant 115, Chloropentafluoroethane                               | 2-361 |
| 2-220          | Thermodynamic Properties of Heptane   | 2-274 | 2-274 | Thermodynamic Properties of R-116, Hexafluoroethane                              | 2-362 |
| 2-221          | Thermodynamic Properties of Hexane  | 2-276 | 2-275 | Thermodynamic Properties of R-123, 2,2-Dichloro-1,1,1-Trifluoroethane            | 2-365 |
| 2-222          | Saturated Hydrazine   | 2-278 |       | Enthalpy-Log-Pressure Diagram for Refrigerant 123                                |       |
| 2-223          | Thermodynamic Properties of Normal Hydrogen                                       | 2-279 |       | (Fig. 2-24)  | 2-366 |
| 2-224          | Thermodynamic Properties of <i>para</i> -Hydrogen                                 | 2-281 | 2-276 | Thermodynamic Properties of R-124, 2-Chloro-1,1,1,2-Tetrafluoroethane            | 2-367 |
| 2-225          | Saturated Hydrogen Peroxide   | 2-282 | 2-277 | Thermodynamic Properties of R-125, Pentafluoroethane                             | 2-369 |
| 2-226          | Thermodynamic Properties of Hydrogen Sulfide                                      | 2-283 |       | Enthalpy-Log-Pressure Diagram for Refrigerant 125 (Fig. 2-25)                    | 2-371 |
|                | Enthalpy-Concentration Diagram for Aqueous Hydrogen Chloride at 1 atm (Fig. 2-11) | 2-285 | 2-278 | Thermodynamic Properties of R-134a, 1,1,1,2-Tetrafluoroethane                    | 2-372 |
| 2-227          | Thermodynamic Properties of Isobutane   | 2-286 |       | Pressure-Enthalpy Diagram for Refrigerant 134a (Fig. 2-26)                       | 2-374 |
| 2-228          | Thermodynamic Properties of Isobutene (2-Methyl 1-Propene)                        | 2-288 | 2-279 | Thermodynamic Properties of R-141b, 1,1-Dichloro-1-Fluoroethane                  | 2-375 |
| 2-229          | Thermodynamic Properties of Krypton   | 2-290 | 2-280 | Thermodynamic Properties of R-142b, 1-Chloro-1,1-Difluoroethane                  | 2-377 |
| 2-230          | Saturated Lithium   | 2-292 | 2-281 | Thermodynamic Properties of R-143a, 1,1,1-Trifluoroethane                        | 2-379 |
| 2-231          | Lithium Bromide—Water Solutions   | 2-292 | 2-282 | Thermodynamic Properties of R-152a, 1,1-Difluoroethane                           | 2-381 |
| 2-232          | Saturated Mercury   | 2-293 | 2-283 | Saturated Refrigerant 216a, 1,3-Dichloro-1,1,2,2,3,3-Hexafluoropropane           | 2-383 |
|                | Enthalpy-Log-Pressure Diagram for Mercury (Fig. 2-12)                             | 2-295 | 2-284 | Thermodynamic Properties of R-218, Octafluoropropane                             | 2-384 |
| 2-233          | Thermodynamic Properties of Methane   | 2-296 | 2-285 | Thermodynamic Properties of R-227ea, 1,1,1,2,3,3,3-Heptafluoropropane            | 2-386 |
| 2-234          | Thermodynamic Properties of Methanol  | 2-298 | 2-286 | Saturated Refrigerant 245cb, 1,1,1,2,2-Pentafluoropropane                        | 2-388 |
| 2-235          | Thermodynamic Properties of 2-Methyl Butane (Isopentane)                          | 2-300 | 2-287 | Refrigerant RC 318, Octafluorocyclobutane  | 2-388 |
| 2-236          | Thermodynamic Properties of 2-Methyl Pentane (Isohexane)                          | 2-302 | 2-288 | Thermodynamic Properties of R-404A   | 2-389 |
|                |   | 2-304 | 2-289 | Thermodynamic Properties of R-407C   | 2-391 |
| 2-237          | Saturated Methyl Chloride   | 2-304 |       | Pressure-Enthalpy Diagram for Refrigerant 407C (Fig. 2-27)                       | 2-393 |
| 2-238          | Thermodynamic Properties of Neon  | 2-305 | 2-290 | Thermodynamic Properties of R-410A   | 2-394 |

## GENERAL REFERENCES

Considerations of reader interest, space availability, the system or systems of units employed, copyright considerations, etc., have all influenced the revision of material in previous editions for the present edition. Reference is made at numerous places to various specialized works and, when appropriate, to more general works. A listing of general works may be useful to readers in need of further information.

# PHYSICAL PROPERTIES OF PURE SUBSTANCES

**TABLE 2-1 Physical Properties of the Elements and Inorganic Compounds\***

Abbreviations Used in the Table

|   |  |   |  |   |   |
|---|--|---|--|---|---|
| a., acid<br>A., specific gravity with reference to air = 1<br>abs., absolute<br>ac., acetic acid<br>act., acetone<br>al., 95 percent ethyl alcohol<br>alk, alkali ( <i>i.e.</i> , aq. NaOH or KOH)<br>am., amyl (C <sub>5</sub> H <sub>11</sub> )<br>amor., amorphous<br>anh., anhydrous<br>aq., aqueous or water<br>aq. reg., aqua regia | atm., atmosphere or 760 mm. of mercury pressure<br>bk., black<br>brn., brown<br>bz., benzene<br>c., cold<br>cb., cubic<br>cc, cubic centimeter<br>chl., chloroform<br>col., colorless or white<br>conc., concentrated<br>cr., crystals or crystalline<br>d., decomposes<br>D., specific gravity with reference to hydrogen = 1 | d. 50, decomposes at 50°C; 50 d., melts at 50°C with decomposition<br>delq., deliquescent<br>dil., dilute<br>dk., dark<br>eff., effloresces or efflorescent<br>et., ethyl ether<br>expl., explodes<br>gel., gelatinous<br>gly., glycerol (glycerin)<br>gn., green<br>h., hot<br>hex., hexagonal | hyg., hygroscopic<br>i., insoluble<br>ign., ignites<br>lq., liquid<br>lt., light<br>m. al., methyl alcohol<br>mn., monoclinic<br>nd., needles<br>NH <sub>3</sub> , liquid ammonia<br>NH <sub>4</sub> OH, ammonium hydroxide solution<br>oct., octahedral<br>or., orange<br>pd., powder | pl., plates<br>pr., prisms or prismatic<br>pyr., pyridine<br>rhb., rhombic (orthorhombic)<br>s., soluble<br>satd., saturated<br>sl., slightly<br>soln., solution<br>subl., sublimes<br>sulf., sulfides<br>tart. a., tartaric acid<br>tet., tetragonal<br>tr., transition<br>tri., triclinic | trig., trigonal<br>v., very<br>vac., in vacuo<br>vl., violet<br>volt., volatile or volatilizes<br>wh., white<br>yell., yellow<br>∞, soluble in all proportions<br><, less than<br>>, greater than<br>42±, about or near 42<br>-3H <sub>2</sub> O, 100, loses 3 moles of water per formula weight at 100°C |
|---|--|---|--|---|---|

**Formula weights** are based upon the International Atomic Weights in "Atomic Weights of the Elements 2001," *Pure Appl. Chem.*, **75**, 1107, 2003, and are computed to the nearest hundredth.

**Refractive index**, where given for a uniaxial crystal, is for the ordinary (α) ray; where given for a biaxial crystal, the index given is for the median (β) value. Unless otherwise specified, the index is given for the sodium D-line (λ = 589.3 mμ).

**Specific gravity** values are given at room temperatures (15 to 20 °C) unless otherwise indicated by the small figures which follow the value: thus, "5.6<sup>18°C</sup>" indicates a specific gravity of 5.6 for the substance at 18 °C referred to water at 4 °C. In this table the values for the specific gravity of gases are given with reference to air (A) = 1, or hydrogen (D) = 1.

**Melting point** is recorded in a certain case as "82 d." and in some other case as "d. 82," the distinction being made in this manner to indicate that the former is a melting point with decomposition at 82°C, while in the latter decomposition only occurs at 82 °C. Where a value such as "-2H<sub>2</sub>O, 82" is given it indicates loss of 2 moles of water per formula weight of the compound at a temperature of 82 °C.

**Boiling point** is given at atmospheric pressure (760 mm. of mercury) unless otherwise indicated; thus, "82<sup>15mm.</sup>" indicates the boiling point is 82°C when the pressure is 15 mm.

**Solubility** is given in parts by weight (of the formula shown at the extreme left) per 100 parts by weight of the solvent; the small superscript indicates the temperature. In the case of gases the solubility is often expressed in some manner as "5<sup>10°</sup> cc" which indicates that at 10 °C, 5 cc. of the gas are soluble in 100 g of the solvent. The symbols of the common mineral acids: H<sub>2</sub>SO<sub>4</sub>, HNO<sub>3</sub>, HCl, etc., represent dilute aqueous solutions of these acids. See also special tables on Solubility.

\* Usual commercial form.

† The solubility of CaCO<sub>3</sub> in H<sub>2</sub>O is greatly increased by increasing the amount of CO<sub>2</sub> in the H<sub>2</sub>O.

TABLE 2-1 Physical Properties of the Elements and Inorganic Compounds (Continued)

| Name  | Formula   | Formula weight | Color, crystalline form and refractive index | Specific gravity   | Melting point, °C        | Boiling point, °C        | Solubility in 100 parts                     |  |  |

This table of the physical properties includes the organic compounds of most general interest. For the properties of other organic compounds, reference must be made to larger tables in Lange's *Handbook of Chemistry* (Handbook Publishers), *Handbook of Chemistry and Physics* (Chemical Rubber Publishing Co.), Van Nostrand's *Chemical Annual*, *International Critical Tables* (McGraw-Hill), and similar works.

The **molecular weights** are based on the atomic weight values in "Atomic weights of the Elements 2001," *PURE Appl. Chem.*, **75**, 1107, 2003. The **densities** are given for the temperature indicated and

are usually referred to water at 4°C, e.g., 1.028<sup>95/4</sup> a density of 1.028 at 95° C referred to water at 4° C, the 4 being omitted when it is not clear whether the reference is to water at 4° C or at the temperature indicated by the upper figure. The melting and boiling points given have been selected from available data as probably the most accurate. The **solubility** is given in grams of the substance in 100 of the solvent. In the case of gases, the solubility is often expressed in some manner as "5<sup>10</sup> cc." which indicates that, at 10° C, 5 cc. of the gas are soluble in 100 of the solvent.

| Name                         | Synonym                         | Formula   | Formula weight | Form and color | Specific gravity       | Melting point, °C    | Boiling point, °C    | Solubility in 100 parts |                       |                   |

\*SOURCE: Murphy and Koop, *Q. J. R. Meteorol. Soc.*, **131**, 1539 (2005). The formula in the reference extends down to 123 K (-150.15 °C), although in practice pure liquid water cannot be supercooled below about 235 K.

## UNITS CONVERSIONS

For this subsection, the following units conversions are applicable:

$$^{\circ}\text{F} = \% \text{ } ^{\circ}\text{C} + 32.$$

To convert millimeters of mercury to pounds-force per square inch, multiply by 0.01934.

## ADDITIONAL REFERENCES

Additional vapor-pressure data may be found in major thermodynamic property databases, such as those produced by the AIChE's DIPPER program ([www.aiche.org/dipper](http://www.aiche.org/dipper)), NIST's Thermodynamics Research Center ([trc.nist.gov](http://trc.nist.gov)), the Dortmund Databank ([www.ddb.de](http://www.ddb.de)), and the Physical Property Data Service ([www.ppps.co.uk](http://www.ppps.co.uk)). From E. W. Lemmon, M. O. McLinden, and D. G. Friend, "Thermophysical Properties of Fluid Systems" in *NIST Chemistry WebBook*, NIST Standard Reference Database Number 69, Eds. P. J. Linstrom and W. G. Mallard, June 2005, National Institute of Standards and Technology, Gaithersburg, Md. (<http://webbook.nist.gov>) and Wagner, W., and A., Pruss, "The IAPWS Formulation 1995 for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use," *J. Phys. Chem. Ref. Data* **31**(2):387–535, 2002.

The website mentioned above allows users to generate their own tables of thermodynamic properties. The user can select the units as well as the temperatures and/or pressures for which properties are to be generated. The results can then be copied into spreadsheets or other files.

TABLE 2-6 Substances in Tables 2-8, 2-32, 2-141, 2-150, 2-153, 2-155, 2-156, 2-179, 2-312, 2-313, 2-314, and 2-315 Sorted by Chemical Family

Vapor pressure  $P_v$  is calculated by

$$P_v = \exp(C1 + C2/T + C3 \ln T + C4 T^{C5})$$

where  $P_v$  is in Pa and  $T$  is in K. All substances are listed by chemical family in Table 2-6 and by formula in Table 2-7.

Values in this table were taken from the Design Institute for Physical Properties (DIPPR) of the American Institute of Chemical Engineers (AIChE), copyright 2007 AIChE and reproduced with permission of AIChE and of the DIPPR Evaluated Process Design Data Project Steering Committee. Their source should be cited as R. L. Rowley, W. V. Wilding, J. L. Oscarson, Y. Yang, N. A. Zundel, T. E. Daubert, R. P. Danner, DIPPR® Data Compilation of Pure Chemical Properties, Design Institute for Physical Properties, AIChE, New York (2007).

The number of digits provided for values at  $T_{\min}$  and  $T_{\max}$  was chosen for uniformity of appearance and formatting; these do not represent the uncertainties of the physical quantities, but are the result of calculations from the standard thermophysical property formulations within a fixed format.

TABLE 2-9 Vapor Pressures of Inorganic Compounds, up to 1 atm\*

| Compound              |   | Pressure, mmHg  |        |        |        |        |        |        |        |        |        | Melting point, °C |
|-----------------------|---|-----------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|-------------------|

VAPOR PRESSURES OF SOLUTIONS

UNITS CONVERSIONS

For this subsection, the following units conversions are applicable:

$$^{\circ}\text{F} = \%^{\circ}\text{C} + 32$$

To convert millimeters of mercury to pounds-force per square inch, multiply by 0.01934.

To convert cubic feet to cubic meters, multiply by 0.02832.  
 To convert bars to pounds-force per square inch, multiply by 14.504.  
 To convert bars to kilopascals, multiply by  $1 \times 10^2$ .

TABLE 2-11 Partial Pressures of Water over Aqueous Solutions of HCl\*

$\log_{10} p_{\text{mm}} = A - B/T$ , ( $T$  in  $K$ ), which, however, agrees only approximately with the table. The table is more nearly correct.  
 Partial pressure of  $\text{H}_2\text{O}$ , mmHg,  $^{\circ}\text{C}$

| % HCl | A       | B    | 0°   | 5°   | 10°  | 15°  | 20°  | 25°  | 30°  | 35°  | 40°  | 45°  | 50°  | 60°  | 70°  | 80°  | 90°  | 100° | 110° |

\*Uncertainty, ca. 2 percent for solutions of 15 to 30 percent HCl between 0 and 100°; for solutions of > 30 percent HCl the accuracy is ca. 5 percent at the lower temperatures and ca. 15 percent at the higher temperatures. Below 15 percent HCl, the uncertainty is ca. 5 percent at the lower temperatures and higher strengths to ca. 15 to 20 percent at the lower strengths and perhaps 15 to 20 percent at the higher temperatures and lower strengths.  
*International Critical Tables*, vol. 3, p. 301.

\*Uncertainty, ca. 2 percent for solutions of 15 to 30 percent HCl between 0 and 100°; for solutions of > 30 percent HCl the accuracy is ca. 5 percent at the lower temperatures and ca. 15 percent at the higher temperatures. Below 15 percent HCl, the uncertainty is ca. 5 percent at the lower temperatures and higher strengths to ca. 15 to 20 percent at the lower strengths and perhaps 15 to 20 percent at the higher temperatures and lower strengths.

The values in Tables 2-23 to 2-26 were generated from the NIST REFPROP software (Lemmon, E. W., McLinden, M. O., and Huber, M. L., NIST Standard Reference Database 23: Reference Fluid Thermodynamic and Transport Properties—REFPROP, Version 7.0, National Institute of Standards and Technology, Standard Reference Data Program, Gaithersburg, Md., 2002). The primary source for the properties of aqueous ammonia mixtures is R. Tillner-Roth and D. G. Friend, "A Helmholtz Free Energy Formulation of the Thermodynamic Properties of the Mixture {Water + Ammonia}," *J. Phys. Chem. Ref. Data* 27:63–96 (1998).

**TABLE 2-24 Mole Percentages of H<sub>2</sub>O over Aqueous Solutions of NH<sub>3</sub>**

| <i>t</i> , °F | Liquid mole percent NH <sub>3</sub><br>(liquid weight percent NH <sub>3</sub> ) |        |        |        |        |        |        |       |       |       |       |       |       |       |       |       |       |       |       |       |

The values in Tables 2-23 to 2-26 were generated from the NIST REFPROP software (Lemmon, E. W., McLinden, M. O., and Huber, M. L., NIST Standard Reference Database 23: Reference Fluid Thermodynamic and Transport Properties—REFPROP, Version 7.0, National Institute of Standards and Technology, Standard Reference Data Program, Gaithersburg, Md., 2002). The primary source for the properties of aqueous ammonia mixtures is R. Tillner-Roth and D. G. Friend, "A Helmholtz Free Energy Formulation of the Thermodynamic Properties of the Mixture (Water + Ammonia)," *J. Phys. Chem. Ref. Data* 27:63–96 (1998).

WATER-VAPOR CONTENT OF GASES

CHART FOR GASES AT HIGH PRESSURES

The accompanying figure is useful in determining the water-vapor content of air at high pressure in contact with liquid water.

FIG. 2-4 Water content of air,  $^{\circ}\text{C} = (^{\circ}\text{F} - 32) \times \frac{5}{9}$ . (Landsbaum, Dadds, and Stutzman. Reprinted from vol. 47, January 1955 issue of Ind. Eng. Chem. [p. 192]. Copyright 1955 by the American Chemical Society and reproduced by permission of the copyright owner.)

## DENSITIES OF PURE SUBSTANCES

\*From "Mercury—Density and Thermal Expansion at Atmospheric Pressure and Temperatures from 0 to 350 °C," *Tables of Standard Handbook Data*, Standartov, Moscow, 1978. The density values obtainable from those cited for the specific volume of the saturated liquid in the "Thermodynamic Properties" subsection show minor differences. No attempt was made to adjust either set.

TABLE 2-32 Densities of Inorganic and Organic Liquids (mol/dm<sup>3</sup>)

| Cmpd. no. | Name                 | Formula                                       | CAS no.     | Mol. wt. | C1      | C2      | C3     | C4      | T <sub>min</sub> , K | Density at T <sub>min</sub> | T <sub>max</sub> , K | Density at T <sub>max</sub> |
|-----------|----------------------|---|-------------|----------|---------|---------|--------|---------|----------------------|-----------------------------|----------------------|-----------------------------|
| 1         | Acetaldehyde         | C <sub>2</sub> H <sub>4</sub> O               | 75-07-0     | 44.053   | 1.6994  | 0.26167 | 466    | 0.2913  | 150.15               | 21.499                      | 466.00               | 6.4944                      |

Except for *o*-terphenyl and water, liquid density  $\rho$  is calculated by

$$\rho = C1/C2^{1+(1-T/C3)^{C4}}$$

where  $\rho$  is in mol/dm<sup>3</sup> and  $T$  is in K. The pressure is equal to the vapor pressure for pressures greater than 1 atm and equal to 1 atm when the vapor pressure is less than 1 atm.

Equation (2), used for the limited temperature ranges as noted for *o*-terphenyl and water, is

$$\rho = C1 + C2T + C3T^2 + C4T^3$$

For water over the entire temperature range of 273.16 to 647.096 K, use

$$\rho = 17.863 + 58.606\tau^{0.35} - 95.396\tau^{0.3} + 213.89\tau - 141.26\tau^{4.3}$$

where  $\tau = 1 - T/647.096$ .

All substances are listed by chemical family in Table 2-6 and by formula in Table 2-7.

Values in this table were taken from the Design Institute for Physical Properties (DIPPR) of the American Institute of Chemical Engineers (AIChE), copyright 2007 AIChE and reproduced with permission of AIChE and of the DIPPR Evaluated Process Design Data Project Steering Committee. Their source should be cited as R. L. Rowley, W. V. Wilding, J. L. Oscarson, Y. Yang, N. A. Zundel, T. E. Daubert, R. P. Danner, DIPPR® Data Compilation of Pure Chemical Properties, Design Institute for Physical Properties, AIChE, New York (2007).

The number of digits provided for values at  $T_{\min}$  and  $T_{\max}$  was chosen for uniformity of appearance and formatting; these do not represent the uncertainties of the physical quantities, but are the result of calculations from the standard thermophysical property formulations within a fixed format.

## DENSITIES OF AQUEOUS INORGANIC SOLUTIONS AT 1 ATM

## UNITS AND UNITS CONVERSIONS

Most densities are given in grams per cubic centimeter. To convert to pounds per cubic foot, multiply by 62.43. °F = % °C + 32. Compositions are weight percent unless otherwise stated.

## DENSITIES OF AQUEOUS ORGANIC SOLUTIONS\*

### UNITS AND UNITS CONVERSIONS

Unless otherwise noted, densities are given in grams per cubic centimeter. To convert to pounds per cubic foot, multiply by 62.43.

$$^{\circ}\text{F} = \% \text{ }^{\circ}\text{C} + 32$$

From *International Critical Tables*, vol. 3, pp. 115–129 unless otherwise stated. All compositions are in weight percent in vacuo. All density values are  $d_4^t = \text{g/mL}$  in vacuo.

\*For gasoline and aircraft fuels see Hibbard, NACA Res. Mem. E56121 (declassified 1958).

2-122 PHYSICAL AND CHEMICAL DATA

TABLE 2-119 Densities of Aqueous Solutions of Miscellaneous Organic Compounds\*

$d$ ,  $d_w$ , and  $d_s$  are the density of the solution, pure water, and pure liquid solute, respectively, all in g/mL.  $p_s$  is the wt % solute. 0.0<sub>2</sub>255 means  $2.55 \times 10^{-4}$ .

| Section A $d = d_w + Ap_s + Bp_s^2 + Cp_s^3$         |   |          |              |                        |                        |                        |

NOTE: Above the horizontal line the condensed phase is solid; below the line, it is liquid.

°R = % K.

† Polycrystalline form tabulated. Similar tables for an additional 45 elements appear in the *Handbook of Heat Transfer*, 2d ed., McGraw-Hill, New York, 1984.

## SOLUBILITIES

### UNITS CONVERSIONS

For this subsection, the following units conversions are applicable:

$$°F = \% °C + 32.$$

To convert cubic centimeters to cubic feet, multiply by  $3.532 \times 10^{-5}$ .

To convert millimeters of mercury to pounds-force per square inch, multiply by 0.01934.

To convert grams per liter to pounds per cubic foot, multiply by  $6.243 \times 10^{-2}$ .

A database containing solubilities originally published in the International Union for Pure and Applied Chemistry (IUPAC)-National Institute of Standards and Technology (NIST) Solubility Data Series is now available at no cost online at <http://srdata.nist.gov/solubility>.

**TABLE 2-122 Solubilities of Inorganic Compounds in Water at Various Temperatures\***

This table shows the grams of anhydrous substance that are soluble in 100 g of water at the temperature in degrees Celsius as indicated; when the name is followed by †, the value is expressed in grams of substance in 100 cm<sup>3</sup> of saturated solution. Solid phase gives the hydrated form in equilibrium with the saturated solution.

\*By N. A. Lange; abridged from "Table of Solubilities of Inorganic Compounds in Water at Various Temperatures" in *Lange's Handbook of Chemistry*, 10th ed., McGraw-Hill, New York, 1961 (except for NaCl, which is from *CRC Handbook of Chemistry and Physics*, 86th ed., CRC Press, 2005). For tables of the solubility of gases in water at various temperatures, Atack (*Handbook of Chemical Data*, Reinhold, New York, 1957) gives values at closer temperature intervals, usually 1 or 5 °C, than are tabulated here. For materials marked by †, additional data are given in tables subsequent to this one. For the solubility of various hydrocarbons in water at high pressures see *J. Chem. Eng. Data*, **4**, 212 (1959).

TABLE 2-122 Solubilities of Inorganic Compounds in Water at Various Temperatures (Continued)

|    | Substance            | Formula   | Solid phase        | 0 °C  | 10 °C | 20 °C                  | 30 °C | 40 °C | 50 °C | 60 °C | 70 °C | 80 °C | 90 °C | 100 °C              |    |
|----|----------------------|---|--------------------|-------|-------|------------------------|-------|-------|-------|-------|-------|-------|-------|---------------------|----|

| Ethylene        | C <sub>2</sub> H <sub>4</sub> | -153.027  | 7,965.2  | 20.5248  | 0            | 287-346    | 11,726         |
| Helium          | He                            | -105.9768 | 4,259.62 | 14.0094  | 0            | 273-348    | 142,900        |
| Hydrogen        | H <sub>2</sub>                | -125.939  | 5,528.45 | 16.8893  | 0            | 273-345    | 70,800         |
| Methane         | CH <sub>4</sub>               | -338.217  | 13,282.1 | 51.9144  | -0.0425831   | 273-523    | 39,200         |
| Nitrogen        | N <sub>2</sub>                | -181.587  | 8,632.13 | 24.7981  | 0            | 273-350    | 84,600         |
| Oxygen          | O <sub>2</sub>                | -171.2542 | 8,391.24 | 23.24323 | 0            | 273-333    | 43,400         |

The constants can be used to calculate solubility by the equation  $\ln x = A + B/T + C \ln T + DT$ , where  $T$  is in K and  $x$  is the mole fraction of the solute dissolved in water when the solute partial pressure is 1 atm. With the assumption that Henry's law is valid up to 1 atm,  $H = 1/x$ . Values of the constants are from P. G. T. Fogg and W. Gerrard, *Solubility of Gases in Liquids*, Wiley, 1991, New York, and *Solubility Data Series*, vol. 1, *Helium and Neon*, IUPAC, Pergamon Press, Oxford, 1979. For higher-temperature behavior and an up-to-date reference list, see R. Fernandez-Prini, J. L. Alvarez, and A. H. Harvey, *J. Phys. Chem. Ref. Data* **32**(2):903, 2003. To find  $H$  at temperatures other than 25°C, first find the solubility and then take the reciprocal.

Values in this table were taken from the Design Institute for Physical Properties (DIPPR) of the American Institute of Chemical Engineers (AIChE), copyright 2007 AIChE and reproduced with permission of AIChE, the DIPPR Environmental Safety Property Data and Estimations Steering Committee and of the DIPPR Evaluated Process Design Data Project Steering Committee. Their source should be cited as T. N. Rogers, D. A. Zei, R. L. Rowley, W. V. Wilding, J. L. Oscarson, Y. Yang, N. A. Zundel, T. E. Daubert, R. P. Danner, DIPPR® Data Compilation of Pure Chemical Properties, Design Institute for Physical Properties, AIChE, New York (2007). Flammability limits are from B. Lewis and G. Von Elbe, *Combustion, Flames and Explosions of Gases*, New York: Harcourt Brace Jovanovich (1987). Flash point data are from N. I. Sax, *Dangerous Properties of Industrial Materials*, 6th ed, New York: Van Nostrand Reinhold (1984). Autoignition data are from I. Glassman, *Combustion*, 3d ed, New York: Academic Press (1996). The ratings reflect DIPPR® ESP's effort to provide a critical evaluation and quality assessment of each data point with 15

being the highest score possible. The rating is not directly correlated with the estimated experimental uncertainty. The ratings reflect DIPPR Project 911's effort to provide a critical evaluation and quality assessment of each data point, with 10 being the highest score possible. The rating is not directly correlated with the estimated experimental uncertainty. Henry's constant is a strong nonlinear function of temperature. A single value measured at one temperature, if used for calculation at a different temperature, can lead to serious errors. Procedures for extrapolation of single-point values over the ambient temperature range (4°C < T < 50°C) are presented in Sec. 22, p. 22-49, under "Estimating Henry's law constants." Estimation procedures for the larger range (4°C < T < 200°C) are presented in F. L. Smith and A. H. Harvey, "Avoid Common Pitfalls When Using Henry's Law," *Chem. Eng. Prog.*, **103**(9), 2007. See also Y.-L. Huang, J. D. Olson, and G. E. Keller II, "Steam Stripping for Removal of Organic Pollutants from Water. 2. Vapor-Liquid Equilibrium Data," *Ind. Eng. Chem. Res.*, **31**, pp. 1759-1768, 1992. (Also see the Supplementary Material, which contains the databank of 404 compounds of environmental interest and other useful property data.)

The  $H$  in Tables 2-123 to 2-134 is the proportionality constant in Henry's law,  $p = Hx$ , where  $x$  is the mole fraction of the solute in the aqueous liquid phase;  $p$  is the partial pressure in atm of the solute in the gas phase; and  $H$  is a proportionality constant, generally referred to as Henry's constant. Values of  $H$  often have considerable uncertainty and are strong functions of temperature. To convert values of  $H$  at 25°C from atm to atm/(mol/m<sup>3</sup>), divide by the molar density of water at 25°C, which is 55,342 mol/m<sup>3</sup>. Henry's law is valid only for dilute solutions.

Additional values of Henry's constant can be found in "Environmental Simulation Program": OLI Systems, Inc., Morris Plains, N.J.; "Estimated Henry's Law Constant," EPA Online Tools for Site Assessment Calculation (<http://www.epa.gov/athens/learn2model/part-two/onsite/esthenry.htm>); "Compilation of Henry's Law Constants for Inorganic and Organic Species of Potential Importance in Environmental Chemistry," Rolf Sander, Air Chemistry Department, Max-Planck Institute of Chemistry, Mainz, Germany; "Modeling Atmospheric Chemistry: Interactions between Gas-Phase Species and Liquid Cloud/Aerosol Particles," Rolf Sander, *Surv. Geophys.* **20**:1-31, 1999 (<http://www.henrys-law.org>).

Henry's constant  $H$  at 25 °C is the vapor pressure at 25 °C times the infinite dilution activity coefficient, also at 25 °C. Infinite dilution activity coefficients are from Mitchell and Jurs, *J. Chem. Inf. Comput. Sci.* **38**: 200 (1998). Henry's constant is a strong nonlinear function of temperature. A single value measured at one temperature, if used for calculation at a different temperature, can lead to serious errors. Procedures for extrapolation of single-point values over the ambient temperature range (4°C <  $T$  < 50°C) are presented in Sec. 22, p. 22–49, under "Estimating Henry's law constants." Estimation procedures for the larger range (4°C <  $T$  < 200°C) are presented in F. L. Smith and A. H. Harvey, "Avoid Common Pitfalls When Using Henry's Law," *Chem. Eng. Prog.*, **103**(9), 2007. \*Selected values from R. Tillner-Roth and D. G. Friend, *J. Phys. Chem. Ref. Data* **27**:63 (1998). This reference lists solubilities for temperatures from –70 to 340°C. Densities, enthalpies, and entropies are listed for both the two-phase and single-phase regions for pressures up to 40 MPa.

## THERMAL EXPANSION

### UNITS CONVERSIONS

For this subsection, the following units conversion is applicable:

$$^{\circ}\text{F} = \% ^{\circ}\text{C} + 32$$

### ADDITIONAL REFERENCES

The tables given under this subject are reprinted by permission from the *Smithsonian Tables*. For more detailed data on thermal expansion, see *International Critical Tables*: tabular index, vol. 3, p. 1; abrasives, vol. 2, p. 87; alloys, vol. 2, p. 463; building stones, vol. 2, p. 54; carbons, vol. 2, p. 303; elements, vol. 1, p. 102; enamels, vol. 2, p. 115; glass, vol.

2, p. 93; metals, vol. 2, p. 459; petroleum, vol. 2, p. 145; porcelains, vol. 2, pp. 70, 78; refractory materials, vol. 2, p. 83; solid insulators, vol. 2, p. 310.

### THERMAL EXPANSION OF GASES

No tables of the coefficients of thermal expansion of gases are given in this edition. The coefficient at constant pressure,  $1/v(\partial v/\partial T)_p$ , for an ideal gas is merely the reciprocal of the absolute temperature. For a real gas or liquid, both it and the coefficient at constant volume,  $1/p(\partial p/\partial T)_v$ , should be calculated either from the equation of state or from tabulated PVT data.

**2-134 PHYSICAL AND CHEMICAL DATA**

**TABLE 2-135 Linear Expansion of the Solid Elements\***

C is the true expansion coefficient at the given temperature; M is the mean coefficient between given temperatures; where one temperature is given, the true coefficient at that temperature is indicated;  $\alpha$  and  $\beta$  are coefficients in formula  $l_t = l_0(1 + \alpha t + \beta t^2)$ ;  $l_0$  is length at 0 °C (unless otherwise indicated, when, if x is the reference temperature,  $l_t = l_x[1 + \alpha(t - t_x) + \beta(t - t_x)^2]$ ;  $l_t$  is length at t °C).

| Element         | Temp., °C | C × 10 <sup>4</sup> | Temp. range, °C | M × 10 <sup>4</sup> | Temp. range, °C | $\alpha \times 10^4$ | $\beta \times 10^6$ |

\* *Smithsonian Tables*. For more complete tabulations see Table 142, *Smithsonian Physical Tables*, 9th ed., 1954; *Handbook of Chemistry and Physics*, 40th ed., pp. 2239–2245. Chemical Rubber Publishing Co.; Goldsmith, and Waterman, WADC-TR-58-476, 1959; Johnson (ed.), WADD-TR-60-56, 1960, etc.

† Molybdenum, 300 to 2500 °C;  $l_t = l_{300}[1 + 5.00 \times 10^{-6}(t - 300) + 10.5 \times 10^{-10}(t - 300)^2]$

Tantalum, 300 to 2800 °C;  $l_t = l_{300}[1 + 6.60 \times 10^{-6}(t - 300) + 5.2 \times 10^{-10}(t - 300)^2]$

Tungsten, 300 to 2700 °C;  $l_t = l_{300}[1 + 4.44 \times 10^{-6}(t - 300) + 4.5 \times 10^{-10}(t - 300)^2]$

Beryllium, 20 to 100 °C;  $12.3 \times 10^{-6}$  per °C.

Columbium, 0 to 100 °C;  $7.2 \times 10^{-6}$  per °C.

Tantalum, 20 to 100 °C;  $6.6 \times 10^{-6}$  per °C.

‡ These values for zinc were taken from Grüneisen and Goens, *Z. Physik.*, **29**:141 (1924).

TABLE 2-136 Linear Expansion of Miscellaneous Substances\*

The coefficient of cubical expansion may be taken as three times the linear coefficient. In the following table,  $t$  is the temperature or range of temperature, and  $C$ , the coefficient of expansion.

| Substance                                 | $t, ^\circ\text{C}$ | $C \times 10^4$ | Substance                          | $t, ^\circ\text{C}$ | $C \times 10^4$ | Substance                           | $t, ^\circ\text{C}$ | $C \times 10^4$ |

TABLE 2-137 Volume Expansion of Liquids\*

If  $V_0$  is the volume at  $0^\circ$ , then at  $t^\circ$  the expansion formula is  $V_t = V_0(1 + \alpha t + \beta t^2 + \gamma t^3)$ . The table gives values of  $\alpha$ ,  $\beta$ , and  $\gamma$ , and of  $C$ , the true coefficient of volume expansion at  $20^\circ$  for some liquids and solutions. The temperature range of the observation is  $\Delta t$ . Values for the coefficient of volume expansion of liquids can be derived from the tables of specific volumes of the saturated liquid given as a function of temperature later in this section.  $C = (dV/dt)/V_0$

| Liquid                          | Range  | $\alpha \times 10^3$ | $\beta \times 10^6$ | $\gamma \times 10^8$ | $C \times 10^3$<br>at $20^\circ$ |

TABLE 2-138 Volume Expansion of Solids\*

If  $v_2$  and  $v_1$  are the volumes at  $t_2$  and  $t_1$ , respectively, then  $v_2 = v_1(1 + C\Delta t)$ ,  $C$  being the coefficient of cubical expansion and  $\Delta t$  the temperature interval. Where only a single temperature is stated,  $C$  represents the true coefficient of volume expansion at that temperature.

JOULE-THOMSON EFFECT

UNITS CONVERSIONS

Joule-Thomson coefficients for substances listed in Table 2-184 are given in tables in the Thermodynamic Properties section.

For this subsection, the following units conversions are applicable:

To convert the Joule-Thomson coefficient,  $\mu$ , in degrees Celsius per atmosphere to degrees Fahrenheit per atmosphere, multiply by 1.8.

$$^{\circ}\text{F} = \% \text{ } ^{\circ}\text{C} + 32; \text{ } ^{\circ}\text{R} = \% \text{ } \text{K}$$

To convert bars to pounds-force per square inch, multiply by 14.504; to convert bars to kilopascals, multiply by  $1 \times 10^2$ .

Gunn, Cheuh, and Prausnitz, *Cryogenics*, **6**, 324 (1966), review equations relating the inversion temperatures and pressures. The ability of various equations of state to relate these was also discussed by Miller, *Ind. Eng. Chem. Fundam.*, **9**, 585 (1970); and Juris and Wenzel, *Am. Inst. Chem. Eng. J.*, **18**, 684 (1972). Perhaps the most detailed review is that of Hendricks, Peller, and Baron. NASA Tech. Note D 6807, 1972.

TABLE 2-140 Approximate Inversion-Curve Locus in Reduced Coordinates ( $T_r = T/T_c$ ;  $P_r = P/P_c$ )<sup>a</sup>

|          |       |       |       |       |       |       |       |       |
|----------|-------|-------|-------|-------|-------|-------|-------|-------|
| $P_r$    | 0     | 0.5   | 1     | 1.5   | 2     | 2.5   | 3     | 4     |
| $T_{rL}$ | 0.782 | 0.800 | 0.818 | 0.838 | 0.859 | 0.880 | 0.903 | 0.953 |
| $T_{rU}$ | 4.984 | 4.916 | 4.847 | 4.777 | 4.706 | 4.633 | 4.550 | 4.401 |
| $P_r$    | 5     | 6     | 7     | 8     | 9     | 10    | 11    | 11.79 |
| $T_{rL}$ | 1.01  | 1.08  | 1.16  | 1.25  | 1.35  | 1.50  | 1.73  | 2.24  |
| $T_{rU}$ | 4.23  | 4.06  | 3.88  | 3.68  | 3.45  | 3.18  | 2.86  | 2.24  |

<sup>a</sup>Calculated from the best three-constant equation recommended by Miller, *Ind. Eng. Chem. Fundam.*, **9**, 585 (1970).  $T_{rL}$  refers to the lower curve, and  $T_{rU}$ , to the upper curve.

## CRITICAL CONSTANTS

All substances are listed by chemical family in Table 2-6 and by formula in Table 2-7.

Values in this table were taken from the Design Institute for Physical Properties (DIPPR) of the American Institute of Chemical Engineers (AIChE), copyright 2007 AIChE and reproduced with permission of AIChE and of the DIPPR Evaluated Process Design Data Project Steering Committee. Their source should be cited as R. L. Rowley, W. V. Wilding, J. L. Oscarson, Y. Yang, N. A. Zundel, T. E. Daubert, R. P. Danner, DIPPR® Data Compilation of Pure Chemical Properties, Design Institute for Physical Properties, AIChE, New York (2007).

The number of digits provided for the acentric factor was chosen for uniformity of appearance and formatting; these do not represent the uncertainties of the physical quantities, but are the result of calculations from the standard thermophysical property formulations within a fixed format.

## COMPRESSIBILITIES

### INTRODUCTION

The compressibility factor  $Z$  can be calculated by using the defining equation  $Z = PV/(RT)$ , where  $P$  is pressure,  $V$  is molar volume,  $R$  is the gas constant, and  $T$  is absolute temperature. Values of  $P$ ,  $V$ , and  $T$  for substances listed in Table 2-184 are given in tables in the Thermodynamic Properties section. For the units used in these tables,  $R$  is 0.008314472 MPa·dm<sup>3</sup>/(mol·K). Values at temperatures and pressures other than those in the tables can be generated for many of the substances in Table 2-184 by going to <http://webbook.nist.gov> and selecting NIST Chemistry WebBook, then Thermo-

physical Properties of Fluid Systems High Accuracy Data. Results can be pasted into a spreadsheet to facilitate calculation of the compressibility factor.

### UNITS CONVERSIONS

For this subsection, the following units conversions are applicable:

$$^{\circ}\text{R} = \% \text{ K}$$

To convert bars to pounds-force per cubic inch, multiply by 14.504.  
To convert bars to kilopascals, multiply by  $1 \times 10^2$ .

## 2-144 PHYSICAL AND CHEMICAL DATA

**TABLE 2-145 Compressibilities of Liquids\***

At the constant temperature  $T$ , the compressibility  $\beta = (1/\bar{V}_0)(dV/dP)$ . In general as  $P$  increases,  $\beta$  decreases rapidly at first and then slowly; the change of  $\beta$  with  $T$  is large at low pressures but very small at pressures above 1000 to 2000 megabars. 1 megabar = 0.987 atm =  $10^6$  dynes/cm<sup>2</sup> based upon the older usage, 1 bar = 1 dyne/cm<sup>2</sup>.

\* *Smithsonian Tables*, Table 106.

Scott (*Cryogenic Engineering*, Van Nostrand, Princeton, N.J., 1959) gives data for liquid nitrogen (p. 283), oxygen (p. 276), and hydrogen (p. 303). For a convenient index to the high-pressure work of Bridgman, see *American Institute of Physics Handbook*, p. 2-163, McGraw-Hill, New York, 1957.

**TABLE 2-146 Compressibilities of Solids**

Many data on the compressibility of solids obtained prior to 1926 are contained in Gruneisen, *Handbuch der Physik*, vol. 10, Springer, Berlin, 1926, pp. 1-52; also available as translation, NASA RE 2-18-59W, 1959. See also Tables 271, 273, 276, 278, and other material in *Smithsonian Physical Tables*, 9th ed., 1954. For a review of high-pressure work to 1946, see Bridgman, *Rev. Mod. Phys.*, **18**, 1 (1946).

## LATENT HEATS

### UNITS CONVERSIONS

For this subsection, the following units conversions are applicable:

$$^{\circ}\text{F} = \frac{9}{5}^{\circ}\text{C} + 32$$

To convert calories per gram-mole to British thermal units per

pound-mole, multiply by 1.799; to convert calories per gram to British thermal units per pound, multiply by 1.799.

To convert millimeters of mercury to pounds-force per square inch, multiply by  $1.934 \times 10^{-2}$ .

TABLE 2-147 Heats of Fusion and Vaporization of the Elements and Inorganic Compounds\*

Unless stated otherwise, the values have been taken from the compilations by K. K. Kelley on "Heats of Fusion of Inorganic Compounds," U.S. Bur. Mines Bull. 393 (1936), and "The Free Energies of Vaporization and Vapor Pressures of Inorganic Substances," U.S. Bur. Mines Bull. 383 (1935).

| Substance   | mp, °C | Heat of fusion, <sup>a,b</sup> cal/mol | bp at 1 atm, °C    | Heat of vaporization, <sup>a,b</sup> cal/mol | Substance  | mp, °C | Heat of fusion, <sup>a,b</sup> cal/mol | bp at 1 atm, °C    | Heat of vaporization, <sup>a,b</sup> cal/mol |
